

## 1 Unbalanced Search Trees

- 1.1 Given the following binary trees, determine if each is a binary search tree, and whether the height of the tree is the same as the height of the optimal binary search tree containing the given elements.

- 1.2 Provide tight asymptotic runtime bounds in terms of  $N$ , the number of nodes in the tree, for the following operations and data structures.

Operations	Binary Search	Red-Black
------------	---------------	-----------

---

**boolean** contains(**T** o);

**void** insert(**T** o);

**T** get(**int** i);

## 2 2-3-Forever

- 2.1 Draw what the 2-3 tree would look like after each step in inserting 18, 12, and 13.

Know how to convert each of these into left-leaning red-black trees!

## 3 New World Order

- 3.1 Given a list of words (possibly repeated), devise a scheme to efficiently return a list of all the words that start with a given prefix.
- 3.2 Given a dictionary of words, describe a procedure for checking if a new word can be created out of the concatenation of two words in the dictionary. For example, if our dictionary contains the words, "news", "paper", "new", and "ape", we should be able to discover the new word, "newspaper".

## 4 Sorting Mechanics *Extra Practice*

- 4.1 Below, the **leftmost column** is an unsorted list of strings. The **rightmost column** gives the same strings in sorted order. Each of the remaining columns gives the contents of the list during some intermediate step of one of the algorithms listed below. Match each column with its corresponding algorithm.

· Merge sort · Quicksort · Heap sort · LSD radix sort · MSD radix sort

For quicksort, choose the topmost element as the pivot. Use the recursive (or top-down) implementation for merge sort.

	A	B	C	D	E	F	G
